MC3242A

MEMORY ADDRESS MULTIPLEXER FOR 16K RAMS

PO BOX 20912 • PHOENIX, ARIZONA 85036

The Motorola MC3242A is an address multiplexer and refresh counter for 16-pin 16K dynamic RAMs that require a 128-cycle refresh. It multiplexes fourteen system address bits to the seven address pins of the memory device. The MC3242A also contains a 7-bit refresh counter that is clocked externally to generate the 128 sequential addresses required for refresh. The high performance of the MC3242A will enhance the high speed of the N-channel RAMs such as the MCM4116.

- Simplifies 16-Pin 16K Dynamic Memory Design
- Reduces Package Count
- 7-Bit Binary Counter for 128 Refresh Address
- Multiplexing: Row Address/Column Address/Refresh Address
- High Input Impedance for Minimum Loading of Bus:

 $I_F = 0.25 \text{ mA Max}$

 Schottky TTL for High Performance Address Input to Output Delay —

 $t_{AO} = 25 \text{ ns } @ C_1 = 250 \text{ pF}$

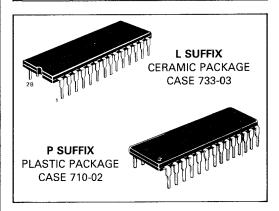

• Second Source to Intel 3242

(Detect Zero Function Not Included and Additional Chip Enable Feature Added at Pin 15)

"Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum ratings for extended periods may affect reliability.

ELECTRICAL CHARACTERISTICS (Unless otherwise noted, Min/Max values apply with 4.5 V \leq V_{CC} \leq 5.5 V, 0°C \leq T_A \leq 75°C; typical values apply with V_{CC} = 5.0 V, T_A = 25°C.)

PIN DEFINITIONS

Count Input - Pin 1

Active low input increments internal 6-bit counter by one for each count pulse in.

Refresh Enable Input - Pin 2

Active high input which determines whether the MC3242A is in refresh mode (H) or address enable (L).

A0-A6 Inputs - Pins 9, 5, 7, 21, 23, 27 Row address inputs.

A7-A13 Inputs — Pins 10, 6, 8, 20, 22, 24, 26 Column address inputs.

00-06 Outputs - Pins 11, 12, 13, 18, 17, 16, 19

Address outputs to memories. Inverted with respect to address inputs.

Gnd - Pin 14

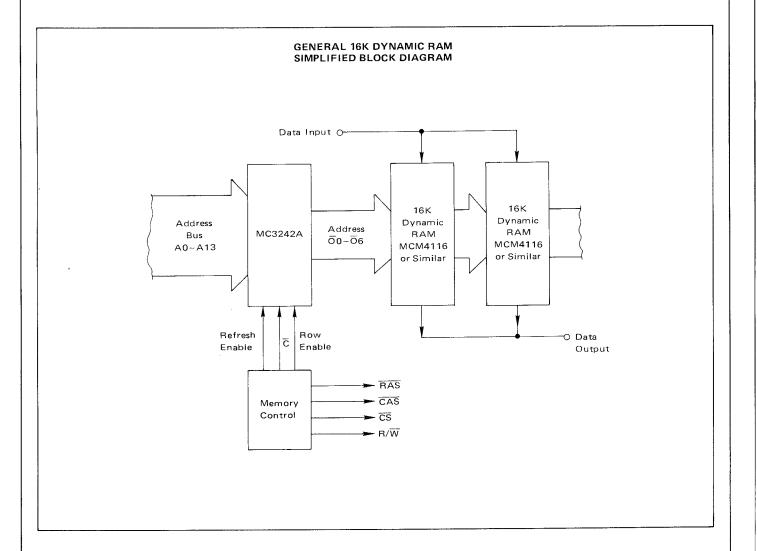

Power supply ground.

CE Input - Pin 15

Optional use, chip enable control pin. Left open, an internal 50 $k\Omega$ pullup resistor keeps this pin high and the MC3242A is a functional replacement for the Intel 3242 (without detect zero function). As an active input, when pulled low, all 3242A outputs go three-state.

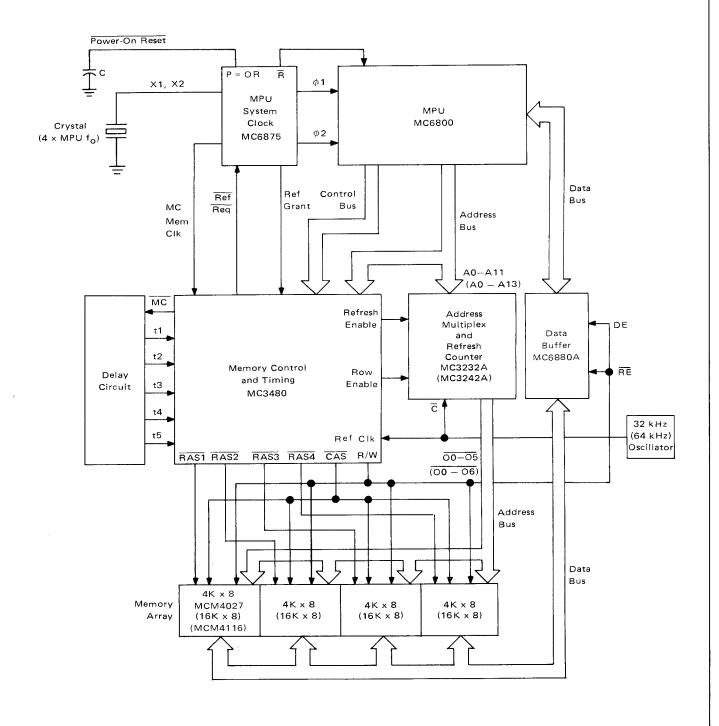

V_{CC} - Pin 28

+5 V power supply input. Due to high capacitance drive capability, a 0.1 μF capacitor should be used to ground along with careful VCC and Gnd Bus layout.

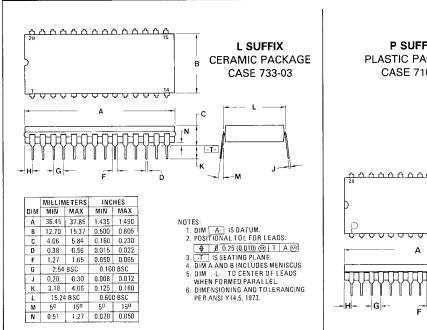

TYPICAL APPLICATION 16K X 8-BIT MEMORY SYSTEM FOR M6800 MPU

Note: Numbers in parenthesis indicate part types or values for $16K \times 1$ RAMs

THERMAL INFORMATION

The maximum power consumption an integrated circuit can tolerate at a given operating ambient temperature, can be found from the equation:

$$P_{D(T_A)} = \frac{T_{J(max)} - T_A}{R_{\theta JA}(Typ)}$$

Where: $P_{D(T_A)}$ = Power Dissipation allowable at a given operating ambient temperature. This must be greater than the sum of the products of the supply voltages and supply currents at the worst case operating condition.

 $T_{J(max)}$ = Maximum Operating Junction Temperature as listed in the Maximum Ratings Section

TA = Maximum Desired Operating Ambient Temperature

 $R_{\theta JA}(Typ)$ = Typical Thermal Resistance Junction to Ambient
